

Lab: SQL injection UNION attack, retrieving data from other tables

Lab: SQL injection UNION attack, retrieving data from other tables

PRACTITIONER

LAB

Solved

This lab contains a SQL injection vulnerability in the product category filter. The results from the query are returned in the application's response, so you can use a UNION attack to retrieve data from other tables. To construct such an attack, you need to combine some of the techniques you learned in previous labs.

The database contains a different table called `users`, with columns called `username` and `password`.

To solve the lab, perform a SQL injection UNION attack that retrieves all usernames and passwords, and use the information to log in as the `administrator` user.

ACCESS THE LAB

to solve the lab we should perform the following requirement

1 we should get the username and password and then

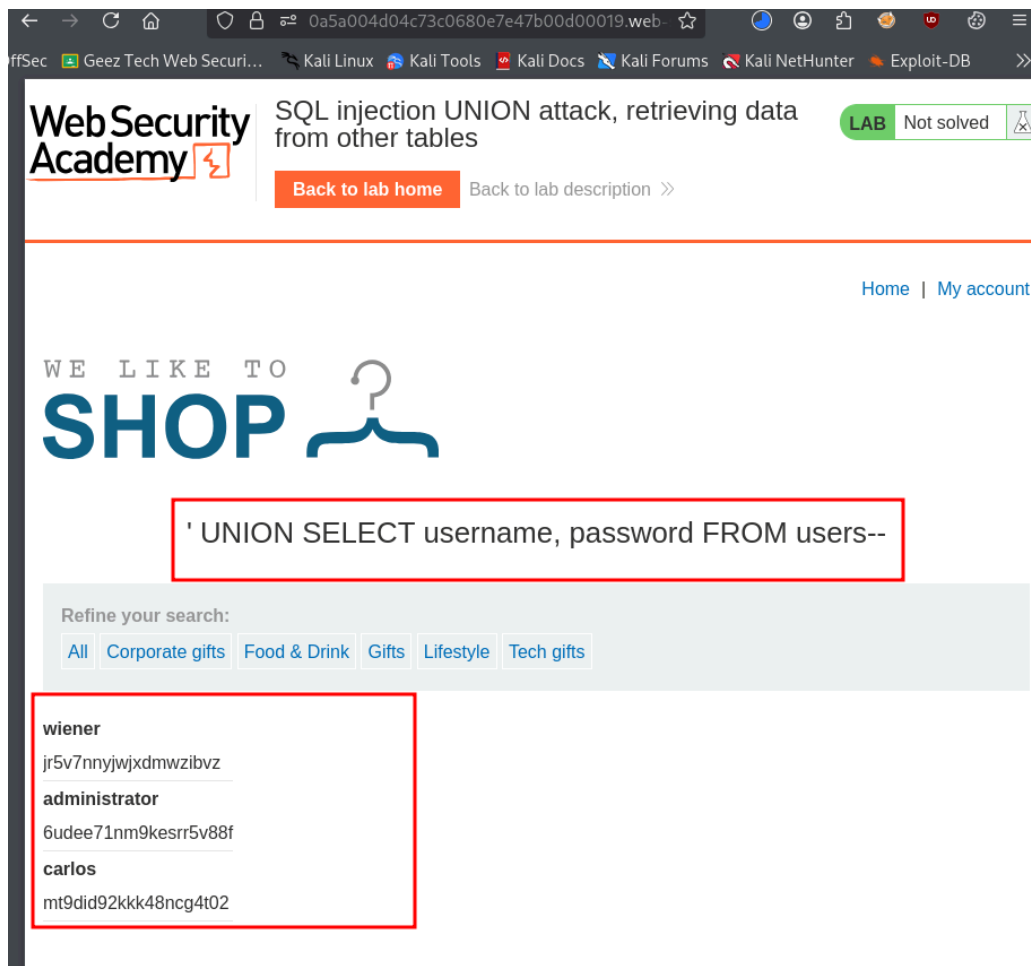

2 access the login page using the credentials we got from union based attack

so we have hints from the lab that it contains the password and username columns in users table so our task is to navigate to the following url on the lab target

by adding the following value on the category parameter

```
' +UNION+SELECT+username,+password+FROM+users--
```

here is what the output looks like

we got the administrator password so our next move is to get access the admin panel using those credential
